

Abstract of DE 20213607

Blood analysis device (2) with a housing body (4), with one a Stechelement (8, 114, 122, 232) showing drawing of blood device (6), with a test means (10) for the reception of a minimal quantity of blood, Auswerteeinrichtung (12) comprehensive with one an Auswerteelektronik and with a notice arrangement (14), that form an as an a single device handhabbares complete system, whereby the housing body (4) one of the working position (34) of the Stechelements (8, 114, 122, 232) User shows and shows are a task position (30) trained at other place the housing body for abandoning one out of of the skin surface pricked before emerging minimal quantity by blood on a test means (10) whereby a majority by test means (10) and Stechelementen (8, 114, 122, 232) is usable into the device, that to the execution of several measurements after each other into a working position (30, 34) bringbar, whereby in positioning (34) the Stechelement in the skin surface designed at the Stechposition (22) of a user einstechbar is and out of the skin surface emerging blood by designing of the skin surface at the task position (30 on a test means (10) abandoned will can, which itself in a working position (32) of the test means finds, marked, in that the test means (10) and the Stechelemente (8, 114, 122, 232) on one vis-à-vis the housing body (4) into the device usable are and that through turning of the carrier (50) the test means (10) and the Stechelemente (8, 114, 122, 232) in working positions different from one another (32, 34) regarding the housing body
